

I chose data that was way too difficult. I am in over my head. I know I've always struggled with programming so it was stupid of me to even think of doing anything more than the bare minimum. Well, I think I've come too far to turn back. I thought I hit a breakthrough on data though honestly I don't know if I can draw a solid conclusion. I'm completely behind on work because I got stuck on data scraping, material that we covered one full week ago. I'm really not cut out for anything programming-related. I should go back to bio. Also, Virginia provides the worst data in existence, providing the most inconsistent naming system for their counties.
